Shradha Goyal (EPGP-13C-107) Shubham Shrivastava (EPGP-13C-108) Tushar Singhaniya (EPGP-13C-119) Vivek Kumar Yadav (EPGP-13C-126) Vivek Revikumar (EPGP-13C-131)

Introduction

Current account deficit is measured primarily through balance of trade. CAD is measurement of a country's trade where the value of the imports (of goods, services) exceeds the value of the exports. Simply put:

Current account deficit indicates that a country is spending more on purchasing foreign goods, than earning from the sale of its domestic goods.

While running in debts, theoretically, is not a positive indication of bank balances; however, in macroeconomic terms, running an account deficit is not always a detrimental situation for a country. It could actually mean that the country could be using external debt for financing investments essential for the growth of the country's economy in the long term.

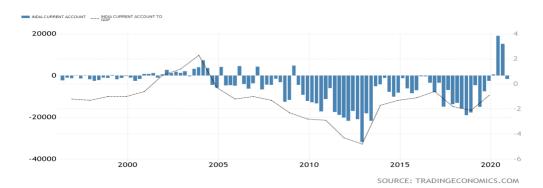

India, being a developing and emerging market economy, typically runs a deficit on current account to supplement domestic savings with foreign savings to fund higher investment. The current account deficit is usually financed by a capital account surplus to maintain BOP.

CAD being harmful or not really depends on the country in question as we can see developed economies like China and Russia are having surplus while on other hand U.S has a huge deficit.

CAD as % of GDP is a key measure. A deficit of over 5% would be cause for greater concern. So, **India** needs manageable current account deficit, not a surplus.

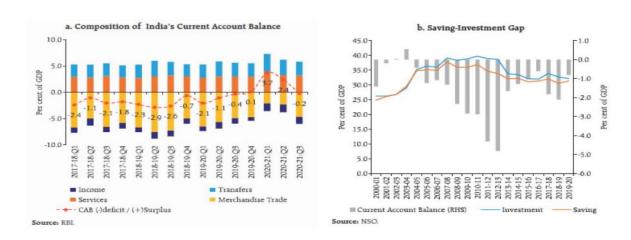

"According to C. Rangarajan, a CAD of 1.6% of GDP is at a sustainable level. However, growing degree of integration of the Indian economy with global economy would imply variability in the size of the CAD and hence, S.S Tarapore, in 1997, recommended a CAD of 2% of GDP as sustainable level. This level was further increased to 3% of GDP by him in 2006 while working with the Committee on Fuller Capital Account Convertibility."

PAGE 1

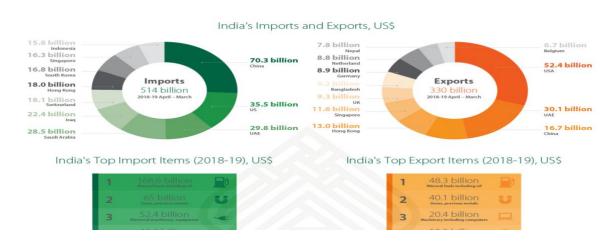

India's current account in Q3 2021 returned to deficit after two quarters, caused by a rise in merchandise trade deficit. The nation's current account recorded a deficit of \$1.7 billion in the Q3 against a surplus of \$15.1 billion in Q2, according to the BOP data published by RBI (Table in Appendix).

- The shift to deficit was primarily due to a merchandise trade deficit that reached \$34.5 billion, up from \$14.8 billion in Q2
- Foreign exchange reserves totaled \$32.5 billion, up from \$31.6 billion in Q2
- Worker remittances fell 7.2% in Q3 on a year-over-year basis, compared with 15.78% in Q2
- Net FDI recorded inflow of \$17 billion as against outflow of \$24.6 billion in Q2
- Net foreign portfolio investment increased to \$21.2 billion compared to \$7 billion in Q2
- External commercial borrowings contributed to a net outflow of \$1.7 billion over an outflow of \$4.1 billion in Q2

India's primary reason of CAD is because of heavy dependence on foreign markets for the needs of our citizens.

- Merchandise trade deficit Exports are less than imports
- High import of crude Oil Oil imports constitute a third of India's imports and half of its CAD
- High import of gold People investing in gold to hedge their risk against price rise.

It is practically impossible for in current economic situation to be completely dependent on its domestic produce and earn an income via exports. India is dependent on imports for some or the other needs, which could be due to unavailability of resources, geographical demographics, availability of manpower or technical expertise. Thus, trade is inevitable between countries. It is essential for us to understand how much trade is healthy for India's economy. Imports and foreign debt help countries build domestic capacities, exports directly add to the country's coffers and push the Gross Domestic Product (GDP).

Additionally, understanding current accounts is also essential to gain insights into the performance of an economy. For instance, CAD tend to increase when the country's economy is flourishing because consumer spending increases and more expenditure being done on imported products. While during recession, CAD tend to dip, due to a decrease in imports amid reduced consumption.

In this report, we will discuss the issues which can happen if India do not maintain a sustainable level of CAD and recommendations to maintain the sustainable level of CAD.

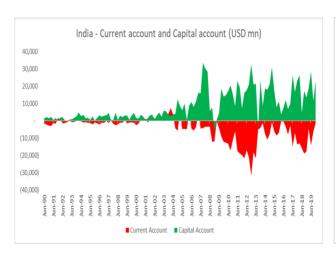

Implications of Not Maintaining Sustainable Level of CAD

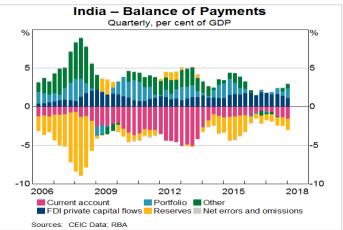

CAD becomes harmful for Indian economy and its GDP, if not maintained at sustainable level and could pose a great concern at multiple fronts:

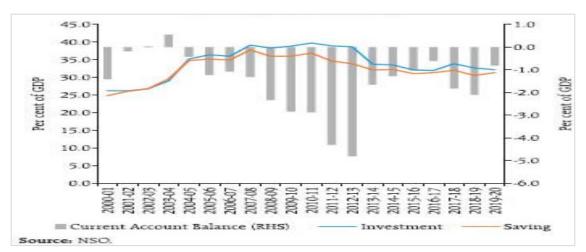

Depletion of foreign reserves:

India use these reserves to keep a fixed exchange rate, maintain exports price competitive, have liquidity in crisis, and to give confidence to investors.

- CAD means net outflow of foreign capital i.e. \$ outflow from India for high imports.
- Without equal or more amount of \$ inflow, a deficit puts strain on India's foreign reserves to fund the imports.
- In deficit, India will depend on external savers to fund part of domestic investment expenditure.

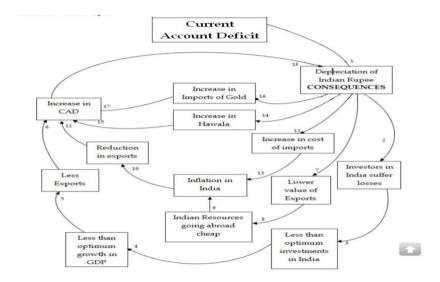

Depreciation of Indian Rupee:

In high CAD, we buy fewer foreign currency or foreigners buy more rupees due to imports. This cause rupee to depreciate and triggers an internal vicious cycle which has consequences

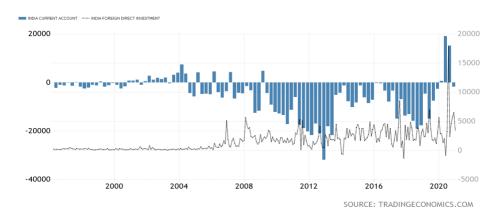

- Interest income of investors will be less and in turn they will suffer losses which in turn will lower the investment in form of FDI and FII.
- It will lead to rise in inflation.
- Imports will be expensive and country will be spending more on essential import commodities like oil etc.

Low Investments:

India, typically runs a deficit on the current account to supplement domestic savings with foreign savings to fund higher investment. If CAD becomes more than sustainable levels then

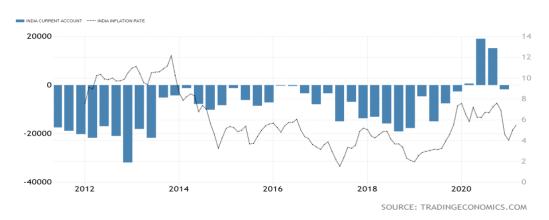

- It led to decline in India's credit rating, directly affecting FDI and FII i.e. low investment
- India needs the foreign inflows to keep its foreign reserves in check and to maintain BOP.

Rise in Inflation:

High inflation affects country's economy and GDP. CAD fuels the inflation. Thus, we need to maintain CAD at sustainable level.

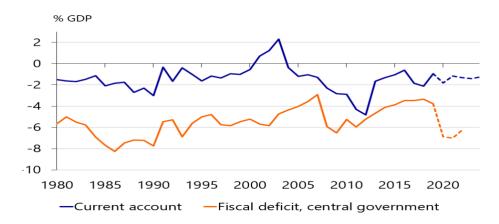

- With depreciation of rupee, value of exports will be lower, Indian resources will be bought at lower prices and Indian income will increase, which in turn will increase the consumption and thus aggregate expenditure, causing a rise in inflation.
- Imports will become expensive and will be spending more on essential import commodities like
 oil etc. which in turn will put economy in supply shock. Thus, increasing price level and to counter
 this effect Government will increase AD, which will further increase price levels.

Twin Deficit:

CAD and government budget deficit at the same time.

High CAD will leave government with less investment and thus budget deficit, results in restriction
on spending on development projects like infrastructure etc., which in turn leaves the supply
shock and thus increase price level.

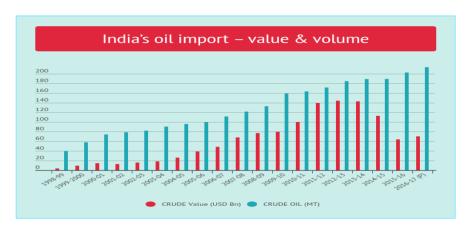

Recommendation For Maintaining Sustainable Level of CAD

After careful study of various indicators of economy, reasons for CAD and its impact on India's economy, Our recommendations is to maintain sustainable level of CAD.

Reduce Oil Imports:

Fluctuating price of oil in international market poses a threat of twin deficit and supply shock. India has already taken initiatives to promote alternate fuel. To reduce oil imports further, government should:

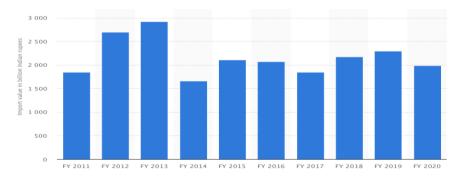

- Bring incremental pricing for large consumers, so that they opt for alternate fuel.
- Remove all subsidies slowly in order to make consumer think of using alternate fuel.
- Bring strong and effective policy on alternate fuel.

Reduce Gold Imports:

India took initiatives like gold monetization scheme, promotion of national savings etc. To reduce gold imports further, government should:

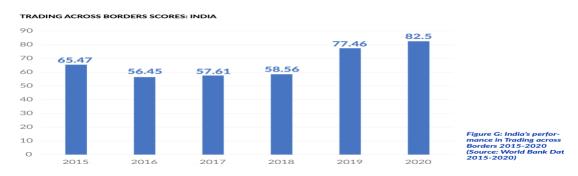

- Provide high growth alternate saving schemes.
- Regulate the gold imports through strict custom and border protections.
- Regulate jewelers and traders through strong policies.

Increase Exports:

Export plays a major role in reducing India's CAD. India introduced policies in recent past like "The Foreign Trade Policy (2015-2020) and (2021-2026)", "Ease of Doing Business 2018/19", Atmanirbhar Bharat and The Export Preparedness Index (EPI) 2020 etc. to boost exports. To further emphasize on exports, government should:

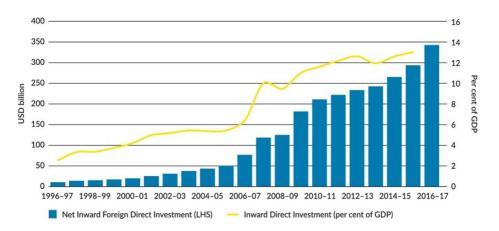

- Focus to enter those lines of production from where China had been weakened due to recent Covid scenarios.
- Bring favorable export promotion policies and create necessary infrastructure for exports.
- Exports diversification and add India to Global value chain.

Attract More FDI and FII:

FDI and FII are needed to supplement domestic savings with foreign savings and to fund higher investment. India took steps like "Make in India", opening sectors like defense, retail, insurance etc. for FDI. To further attract more FDI and FII, government should:

- Not only have FDI specific policies but broader economic policies including corporate taxes, business climate, regulatory issues and burdens etc. to make FDI more attractive.
- Structural reforms to bring drastic increase in FDI and FII.

Apart from the recommendations mentioned above, government can use its policies to tackle CAD

Regulate Through Devaluation of Indian Rupee:

It can be use as extreme measure where government can reduce value of currency against foreign currency. It will help maintain CAD but it depends on elasticity of demand for exports and imports. If there is a devaluation of the currency, the price of imported goods increases and therefore the quantity demanded of imports falls.

Regulate Through Monetary Policy:

Government can increase interest rates.

- Increases the cost of debt and loan repayments. Thus, leave people with less money to spend. Therefore, this will reduce their consumption of imports.
- Cause a fall in AD and therefore reduce economic growth. This will reduce inflation and help to make exports more competitive.
- Put pressure on manufacturers to reduce costs, and this will lead to more competitive exports and exports may increase in the long run.
- The issue with this is that it will tend to cause hot money flows and an appreciation in the exchange rate. This appreciation makes exports less competitive, and imports more attractive. Assuming demand is relatively elastic, this appreciation will worsen the current account.

Regulate Through Fiscal Policy:

Government can increase income tax

- Reduce consumer discretionary income and reduce spending on imports.
- Advantage is that it would not have an adverse effect on the exchange rate. Higher tax would also improve government finances.
- This will conflict with other macroeconomic objectives with lower aggregate demand (AD), growth is likely to fall causing higher unemployment. A government is unlikely to want to risk higher unemployment just to reduce a current account deficit.

Government Protection Measures:

Some measures which government can take from time to time

- Ease the rules for manufacturing industries to increase growth and reduce imports.
- Increase tariffs on imports or even impose quotas. Both these measures would have the impact of reducing imports and therefore improve the current account.
- Mandatory currency hedging for some sectors
- To reduce wages. Lower wages will reduce costs of production and improve competitiveness.
